

About

# Valera Vale

We are breeders of commercial Proughtmaster cattle underpinned by the genetics of our bull breeding operation. As such we are well aware of the profit drivers in the beef industry and realise that a functional breeder herd achieving high survival and calving rates is the main determinant of profitability in breeder and breeder/fattener enterprises. We don't waste selection pressure on anything that isn't related to dollars for a commercial operation.

High levels of breeder performance and environmental adaptation are intrinsically linked because only functional cows are able to maintain body condition to survive, lactate, cycle and fall pregnant in our too often challenging environment. Our cows are run under strictly commercial management conditions so that we can select the genetics that will be profitable for our commercial clients, and are expected to present a healthy calf for branding each year after a fourteen week joining period during which it may or may not rain.

The Bulls we offer you are the product of these efficient females. They are run on Buffel grass pastures under the same conditions as our steers, before silage preparation at Avilion, Greymare. Our aim is to safely prepare the bulls to an impressive but highly functional sale condition without compromising their current and future health. Valera Vale bulls are ready to work as soon as they're off the truck.

We do not believe in over-preparing our bulls and often face discrimination in the marketplace because of it. However, we continue to under prepare our bulls so they can over perform for our clients. As a result, Valera Vale bulls have a reputation for being able to adapt to any of the conditions experienced throughout Northern Australia. We do hear from clients that bulls grow too big but have never had them criticize them for being small.

We do not trim feet. Ever.

We guarantee our bulls in both the short and long term as will be attested by our long term clients. If one of our bulls does not perform to your standards, we need to know so that we can fix the problem.

We were late converts to the breeding of polled cattle, and did not see any problem with dehorning. Our clients began demanding polled bulls and we struggled to accommodate the demand using phenotypically polled and even PNA tested "homozygous poll" sires. We found the existing PNA tests to be very unreliable and they have only ever been presented as having a less than 100% probability of having the right result. With the availability of the more accurate SNP PNA test through Neogen we have been able to select for poll cattle more effectively and have had no further instances of horn calves from inaccurately identified "Polled" bulls. The majority of our calves born now are double polled. We are able to produce large numbers of polled cattle without having to sacrifice selection for other traits by only selecting for polledness in our sires. We do not select for polledness in our females, they are selected based on their reproductive performance.

We are now convinced of the value of breeding polled cattle especially in light of the 2% extra mortality associated with dehorning recorded in the broadly based Cash Cow project.

81% OF THE BULLS OFFERED IN THIS CATALOGUE ARE DOUBLE POLLED.

WE CONFIDENTLY PREDICT THAT NONE OF OUR PCPC BULLS WILL PRODUCE
A HORNED CALF (SCURS ARE POSSIBLE) REGARDLESS OF THE HORN STATUS OF
THE FEMALES. THESE PCPC BULLS CAN DEHORN A HERD IN ONE GENERATION.

# Our Philosophy

These heifers illustrate the style of animal we breed. After over 50 years of selection we have developed a type of Droughtmaster animal that is proven to handle our environment and has widespread market suitability (live export to MSA).

The core of our selection process is the ability to get in calf every year. The result of this philosophy is an animal with higher Brahman content than is currently fashionable (DNA Verified at around 66%), extremely reliable reproductive performance and quite high growth rates.

Research has proven that Bos indicus cattle have a significantly more efficient rumen than Bos taurus animals. This is important for the performance of our herd and our business. As recorded in the report of McLean and Blakeley (MLAProject Code B.NBP.0779) Bos Indicus cows weighing 550Kg and 6 months pregnant have the nutritional requirements of 1.12 Adult Equivalents whereas the same Bos taurus cow requires 1.24 AE. That 10% extra tucker is hard to find sometimes. We contend we have developed a highly adapted herd by indirect selection for a very efficient rumen. Our cattle can survive, thrive, reproduce and grow well in the Northern Australian environment.

The Valera Vale herds have been BJD check tested. The herds have achieved JBA 7 status so all buyers can make decisions with the confidence that these standards are being met.

The bulls have been comprehensively vaccinated against the 5 main Clostridial diseases, Leptospirosis, Vibriosis, Tick Fever, 3 Day Sickness and Botulism. They are tested free of Pestivirus persistent infection and the Genetic Pompes Disease. This inherited wasting disease is present in all Bos indicus and Bos Indicus derived breeds but is recessive so by pro-actively testing our bulls we can guarantee none of their progeny will develop Pompes disease regardless of the genetics of the breeders they are mated to.

The bulls have had a Bull Breeding Soundness Evaluation (BBSE) to Australian Cattle Vets Assoc. standards by experienced and accredited cattle veterinarian Dr. Paul Vetter who will be further

The bulls' semen has been assessed both Crush Side (for live, motile) and in the Laboratory for normal Morphology. There is virtually no evidence that the crush side percentage has any bearing on the number of calves a bull produces once the threshold of 30% alive and progressively motile sperm is exceeded. In fact, the variation in crush side percentage is more due to factors not associated with the bull such as collection technique, operator and recent sexual activity.

Morphology on the other hand is a more useful assessment as there is a well

established association between the number of calves a bull can produce and %Normal sperm and a less well established association with the fertility of his daughters. Importantly, some bulls have consistently very high crush side percentages but have DNA defects which are only picked up by experts with special microscopes in a lab morphology test. These bulls may either be incapable of fertilizing an egg or may produce an embryo that is non-viable and is slipped well before calving. The magic morphology number is set at 50% for a useful bull. In the Bull Power research project, it was demonstrated that while calf output was multi-factorial, all bulls that failed morphology (less than 50% Normal) performed poorly in terms of number of calves sired.

We believe on our results to date in the Valera Vale herds, we have achieved about 4% higher calving rates by using bulls with good sperm morphology than we were over the previous decades of records. All the bulls presented in this catalogue have passed a morphology test i.e. they not only have achieved the threshold of 50% Normal Sperm but do not have excessive levels of any particular defect that will impact fertility.

Our faith in the value of morphology and structural soundness selection is proven by the fact we join our young bulls and heifers at a ratio of 1:80. Some individual bulls produce almost 150 calves in a 3 month joining period.

# Vaccinations

Valera Vale prides itself on our all inclusive animal health program from both an animal welfare and production efficiency perspective.

Botulism (Singvac 3)
3 Day Sickness (BEF)
Vibrio
5 in 1 (Clostridial Diseases)
Trivalent Tick Fever

Due June 2026
Due August 2025
Due August 2025
Due August 2025
Lifelong Immunity

# Droughtmasters WITH DATA

The Bulls will be Sperm Morphology tested, DNA 50K SNP recorded, Sire, Poll gene, and Pompes disease tested, have growth rate data on Silage (to ensure an even playing field) and Dam history presented.

# Genomics - What is it, Why should I care?

Genomics gives us information on the genetic potential of an individual. By analysing the PNA of an animal, we gain insight into its genetic ability to perform in certain areas when under pressure such as environmental stress. Genomics is proven and widely used in the dairy industry but currently underutilised in the beef industy.

We hope to change that.

For example: In a good season, most animals will get in calf within a 4 month period after calving. In a tough season, the animals with a higher genetic potential to get back in calf in the above timeframe are more likely to preg test in calf than animals with a lower genetic potential in this area. By selecting animals with a higher genetic potential in certain areas means we can increase the fertility of the entire herd over time, essentially finding our better adapted cattle prior to the tough season and therefore lessening the economic impact of sub-optimal conditions and increasing the fertility of the herd under pressure.

Valera Vale has used naturally occurring environmental conditions to apply heavy selection pressure to our herd over many years following our strict "One Calf Every Year No Exceptions No Excuses" policy. We see genomic analysis as an essential and exciting way to fast track our progress toward a more fertile, adaptable herd by being able to select superior animals as replacement heifers and sires, prior to external selection pressure being applied.

To quote Ben Hayes, the co-inventor of genomic selection in cattle, we can expect a 2% improvement in the herd every year by incorporating genomic data into our selection criteria. This improvement is cumulative, so in 10 years time, the herd wil be 20% better for the selected traits than it is today.

## Genomic Traits

The scope of current genomic analysis in the Valera Vale herd gives us data of the following traits:

TRAIT TYPE	TRAIT	COMMENT
FEMALE FERTILITY	Heifer Puberty	Affects maiden pregnancy rates, higher rank equals earlier puberty.
	Pregnant within 4 months of Calving (P4M)	Genetic potential to wean a calf every year for consecutive years
GROWTH	Hip Height	There is a possibility being explored that very tall cattle may have lower reproductive efficiency.  This may be true, or may be skewed because the population includes smaller stature bos taurus cattle being compared with some taller
		strains of bos indicus cattle that may have inherently lower fertility for reasons unrelated to hip height.
	Mature Weight	More aligned with 600d weight than earlier weights in traditional EBV's.
TEMPERAMENT	Temperament	Measure of flight score in traditional EBV's. Was not measured directly on our cattle. There are bulls in this catalogue that are a 1 for Temperament, but they wouldn't be in the sale if they werent exceptionally quiet bulls.

The genomic analysis is across many breeds, not just Proughtmasters. Therefore it needs to be realised that a Proughtmaster bull of moderate growth is relative to a population of animals that includes Charolais etc at the heavier end of the population.

# Polled Genetics - The Elephant In The Room

A lot of things have been wrongly implied to be caused by the poll gene in cattle. Including: Preputial Prolapse (Busted Pizzle Bulls), Premature Spiral Deviation of the Penis (PSDP), and reduced serving capacity. Support for this notion has often been garnered by a research paper published almost 40 years ago, pre-dating both genetic testing and increased animal welfare standards, public perception of animal welfare and the pressure of the media. It is worth noting that this study only compared polled and horned populations of different breeds, not horned and polled individuals within the same breed and was heavier on opinion than data.

A systemic literature review by Dr Scott Norman et al (2009) largely debunked these claims using collated data from several cattle veterinarians and beef cattle researchers. They found that PSPP did have a heritable component, but this was unrelated to the polled gene. In fact there were familial lines of horned bulls that had equally high prevalence of PSPP.

In regard to preputial prolapse, the report concluded that factors unrelated to the polled gene, such as sheath structure, have a far greater influence on the likelihood of occurence than any impact of the polled gene. There was no link found between the polled gene or polled cattle and reduced serving capacity. One fact the report did touch on was that the population of polled cattle had a higher incidence of preputial eversion (where the inner skin of the prepuce remains visible). We arent denying it! In fact, we are actively indentifying it in our herd, and selecting against it, and have been for generations. However, this is not caused by the polled gene.

All these points perfectly highlight the need for a strict, multifaceted approach to selection criteria.

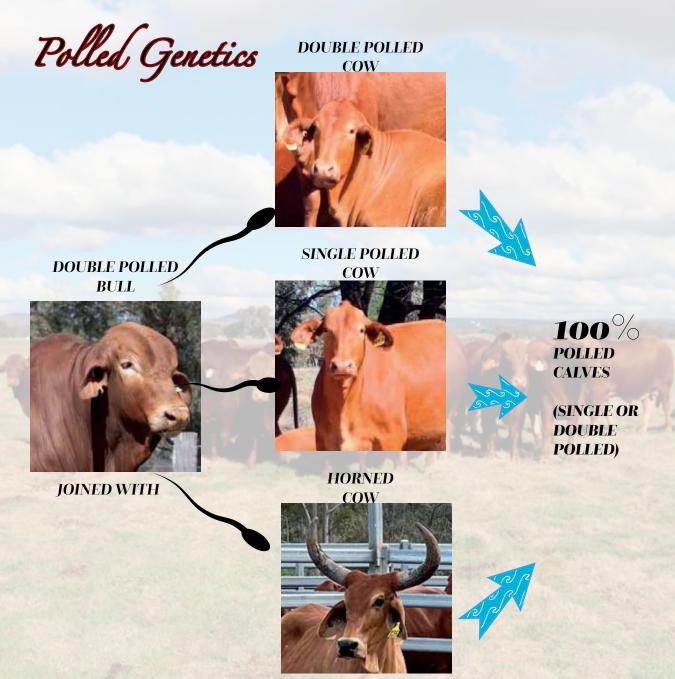

At Valera Vale we brand approximately 1200 bull calves a year. ALL of these are single or double polled. Less than 10% of these are catalogued for our sale. Sheath structure, bull structure, semen morphology, growth, temperament, genomic PNA analysis are all heavily selected for when we are reveiwing which bulls make the sale.

When the poll gene was first selected for in cattle, it was from a population that had, as with any population, other faults. Because there was insufficient selection against these other faults, they have been inadvertently selected for in other populations of cattle and have been wrongly attributed to polledness. The polled gene is responsible for polledness, nothing else. The problem comes with selecting on single genes and losing sight of the big picture. For example: A bull may be polled, and have a bad sheath. If you ignore the sheath on that bull, and use him because he is polled, he will pass on the gene for poll and also the genes for bad sheath. But if you select a polled bull that has a good sheath, he will pass on the polled gene and also the genes for good sheaths. By selecting cattle with good sheaths we are able to keep the poll - without the problem.

One positive of the polled gene is lower mortality, as the Cash Cow project identified at 2% higher in dehorned cattle in the 12 months after branding.

Pictured above - A Valera Vale polled bull showing the style of safe sheath we heavily select for.

## Scurs

What are Scurs? Scurs are horn-like rudimentary structures that occur only on polled cattle. They range from a hairless hard pad the size of a fingernail, to slow growing projections mimicing horns. Scurs are moveable and only attached to skin and connective tissue not bone, although they can seem to attach in older bulls. Scurs occur commonly in single polled bulls, and less commonly in double polled bulls. Scurs are more prominently expressed in bulls than in steers or heifers, which suggests a hormonal or epigenetic component to their expression.

Our herd has some of the few animals in the cattle industry that have had their entire genome analysed. This was done on some of our double polled bulls exhibiting scurs to try to identify the gene responsible for scur inheritance.

At this stage, no one particular gene has been identified, and it is thought that a series of epigenetic factors on severel genes may be at play... This is a developing area and also a long story best kept for another day!

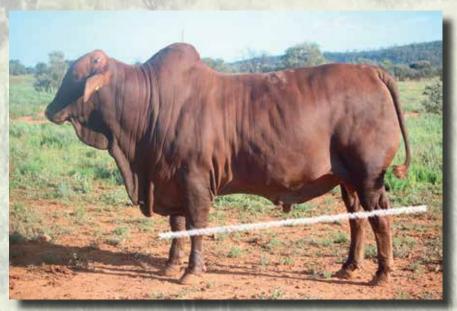

In older research scurs were thought to be partly influenced by the 'African Horned Gene', however the latest research available has failed to identify such a gene and researchers we have spoken with are dubious of its existence. It is quite possible that the theory of the African Horned Gene arose from the inaccuracy of less precise tests for the polled gene than the test we are using through Neogen.

# Sheath Structure - Size Matters!

At Valera Vale one of the things we have strictly selected for over the last few decades is safe sheaths in our bulls. A safe sheath should not be heavy, should have good clearance and have minimal preputial eversion and the bull should demonstrate good retractability.

#### But why is it so important?

A heavy pendulous sheath is an accident waiting to happen. Aside from the fact his breeding career is now finished, a busted pizzle bull is a major welfare issue. So much so that they will not be accepted for salvage slaughter by the majority of meatworks: please see the below flyer circulated by PAFF. At Valera Vale - we aim to keep our sheaths above the knee hock line, not too heavy with minimal rosette in front and good preputial retraction. We can thank our large WA client base for pushing us to do better in this regard, and the progress we have made in the last decade has been immense.

Valera Vale polled bull demonstrating a safe sheath and the 'knee-hock line'.

#### Registration with Droughtmaster Australia

The Flynn family have been breeding Droughtmasters since 1979. The Valera Vale Droughtmaster herd numbers over 6,000 animals including those run on co-operator herds owned by AJ Bush and Sons and David Kassulke at "Argyle Lodge", Beaudesert and by John and Nikki Cleary on "Avilion", Greymare.

The herd is mainly pure Droughtmaster but there has been some infusion of extra Brahman blood in recent times and we buy and have used unregistered pure Droughtmaster bulls from sales such as Glen Fosslyn and Clonlara. We also lack reliable pedigree data on some cows. Because of this some of the bulls catalogued in the sale cannot be registered with the Breed Society through the conventional system and these are identified against the catalogue lots.

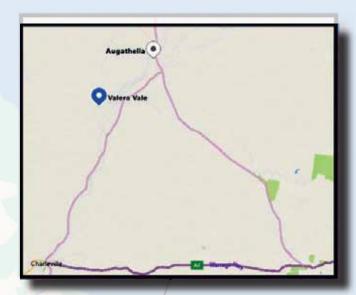

### Eligibility for entry into Western Australia

We have no history of BJD and many clean tests on all of the Valera Vale PICs so meet all the requirements for entry into WA. Fluke testing and drenching required prior to leaving QLD as per WA entry requirements (LB1 part 3) will be undertaken by Valera Vale at no cost to our buyers.

## Location

Valera Vale is located between
Augathella and Charleville in SW Qld.
The homestead and Station Yards are
12km up the formed gravel VALERA
VALE ROAD which runs north west
from the Mitchell Highway between

Charleville with Augathella. The turnoff is just south of the Warrego River bridges 37.1km from the Charleville turnoff south of Augathella and 37.9k from the 100k sign from Charleville. There are air services by Rex Aviation to Charleville from Brisbane and Toowoomba. We will gladly meet any flights and arrange transport.

There is a 1000m grass/gravel airstrip with windsock running 065/245 at the Homestead.

Co-ordinates: 25 59.05 \$ 146 23.76 E Elevation 1115ft

There are SWER powerlines between the Homestead and the 065 threshold.

As usual Valera Vale offers **Free Delivery** to the nearest major centre in QLD (including Mt Isa, Charters Towers, Birdsville and South East Qld) on all bulls purchased at the sale.

For buyers outside QLD as an alternative to free delivery, bulls ravelling to WA or NT will receive \$250 and to NSW \$150 per bull Freight Rebate to assist with their trip home. Please ensure delivery instructions are as clear as possible as outside carriers may be used.

Bulls can be inspected at Avilion, Greymare (21km west of Warwick), prior to Wednesday the 5th of September, or at Valera Vale from 7th of September until sale day. Clients not able to travel west to Valera Vale can choose their bulls at Avilion or by reviewing the data and pre-recorded individual lot videos. We are happy to discuss our recommendations in the catalogue.

The sale will be livestreamed (video and audio) on the stocklive platform allowing clients to make their purchases without leaving home, and the bulls will be delivered to them after the sale at no charge.

Bulls are the purchaser's risk from the fall of the hammer and insurance is recommended.

In 2019 at our lowest point in drought we weaned all the calves down to a month old onto Mi-Feed Roasted Calf Museli. It was a desperate, radical weaning. We were in a position where we had no other option. The cows would have died if we didnt get the calves off them. Getting the calves off is the equivalent of feeding them 3.5kg of grain a day.

Mi-Feed ) It saved them.
